WEEK-2 TASK

Task Name

Banking Account Management System

Abstract

The Banking Account Management System is a database application developed using SQL to manage customer and bank account information. It stores customer details, account details, and maintains relationships using primary and foreign keys. The system supports CRUD (Create, Read, Update, Delete) operations and generates reports for banking records.

Introduction

The Banking Account Management System helps banks maintain customer and account information efficiently. It reduces manual work, improves data accuracy, and provides quick access to account details through SQL database operations.

Objectives

- Design **Customer** and **Account** tables.
- Establish **Primary Key** and **Foreign Key** relationships.
- Store customer and account information.
- Perform **Insert**, **Update**, **Delete**, and **Select** operations.
- Generate reports using SQL **JOIN** queries.
- Improve data accuracy and reduce manual errors.

SQL Code

Create Customer Table

```
CREATE TABLE Account (  
    AccountID INT PRIMARY KEY,  
    CustomerID INT,  
    Balance DECIMAL(10,2),  
    FOREIGN KEY (CustomerID) REFERENCES Customer(CustomerID)  
);
```

Create Account Table

```
CREATE TABLE Account (  
    AccountID INT PRIMARY KEY,  
    CustomerID INT,  
    Balance DECIMAL(10,2),  
    FOREIGN KEY (CustomerID) REFERENCES Customer(CustomerID)  
);
```

Insert Records

```
INSERT INTO Customer VALUES  
(1,'Rahul','Chennai'),  
(2,'Priya','Coimbatore');
```

```
INSERT INTO Account VALUES  
(101,1,50000),  
(102,2,75000);
```

Update Record

```
UPDATE Account  
SET Balance = 55000  
WHERE AccountID = 101;
```

Delete Record

```
DELETE FROM Account  
WHERE AccountID = 102;
```

Display Report

```
SELECT CustomerName, Balance  
FROM Customer  
JOIN Account  
ON Customer.CustomerID = Account.CustomerID;
```

Result

- The Banking Account Management System was successfully implemented using SQL. The Customer and Account tables were created, data was inserted, updated, and deleted successfully. The SQL JOIN query generated a report displaying customer names, cities, account types, and account balances accurately.

Conclusion

- The Banking Account Management System demonstrates the effective use of SQL for database management. It successfully implements table creation, primary and foreign key relationships, CRUD operations, and report generation. The system provides accurate, organized, and efficient management of banking data, making it suitable for basic banking database applications.
